MCAT Question Answer: C

D. Serotonin
C. Dopamine
B. Histamine
A. Epinephrine

Which neurotransmitter is likely to be present in decreased levels in her father's brain?

A woman notices that her father has started to move his fingers in such a way that it looks like he is rolling something, despite nothing actually being there. She also notes slowed movement and a shuffling gait.

This week's test prep question comes from the MCAT:

Radical medicine is an emerging experimental treatment for patients with cancer. A number of patients who have tried the treatment have shown significant improvement in their condition after undergoing chemotherapy. One of the main advantages of this type of treatment is that it 

A. allows for the treatment of patients suffering from otherwise untreatable conditions
B. is non-invasive
C. provides an alternative to surgery
D. eliminates the need for radiation therapy

If you are taking any entrance exam in the next year please sign up today! We want to cheer you on as you study and help you find other people who are working towards the same goals to connect with this year. We also want to celebrate with you when you're done - and we don't know when you're taking these tests unless you let us know! Sign up today!

Are you Taking an Entrance Exam This Year?! If so, register now to receive your free six-week summer enrichment program.

Congratulations to all our pre-med students who completed Mock Interviews on Monday!
